(54) Title: PERSONALIZED GRAPHICS AND TEXT MATERIALS, APPARATUS AND METHOD FOR PRODUCING THE SAME

(57) Abstract

A computer controlled colour graphics printer (16) which responds to input of personal information to provide an output of both personalized text and graphics which may be in the form of a greeting card, a poster or the like. The apparatus includes an input device such as a card reader (11) which responds to personalized data indicated on a card (30) by a customer or user, and means for storing temporarily the personalized data. The apparatus includes means for inputting (11, 12) and storing at least one standard pictorial background display plus appropriate text. The apparatus includes further means (10) for converting the personalized data inputted by the card reader (11) into control signals for pictorial as well as text production appropriate to the background selected and the personalized data inputted. The apparatus includes pictorial and textual output means (16) which respond to the combination of background and personal data input to produce a personalized pictorial and textual document. The method of this invention involves the recording of personalized data, the storage of at least one standard data which includes pictorial information, the method of converting at least some of the personalized data into pictorial representations, combining the standardized pictorial and textual data with the personalized converted pictorial data plus textual data and printing a pictorial and textual product containing the appropriate mixed standard and personalized data.

-1-

PERSONALIZED GRAPHICS AND TEXT MATERIALS, APPARATUS AND METHOD
FOR PRODUCING THE SAME

BACKGROUND OF THE INVENTION

Heretofore, one seeking to present a friend or associate with a greeting card or a poster has the following choices:

1) If he has sufficient creative and artistic talent, he may take a blank card form or a poster and draw and letter an appropriate message, caricature, pictorial display or whatever is desired; or

2) He can seek out a greeting card or a poster retailer and look through the hundreds of choices of cards, attempting to find one which is appropriate for the occasion, and particularly for the recipient.

Few fall into the first category and can make their own acceptable cards, and those who do truly find their talent appreciated, but most of all a great amount of time is expended in not only the creative but in the artistic aspects of making a card. Such activity is reserved by those who have that ability for very special occasions and persons. Most of us fall into the second category and have noted the frustration in attempting to find an appropriate card.

In the case of children, one type of personalized gift has been developed which is sometimes referred to as the "ME" book. These are picture books for very young children in which the name of the child and perhaps his address or the name of his pet are injected into the text of a book, which is then printed and bound in conventional form. These "ME" books have received a degree of acceptance, however, they are hardly appropriate for adults and because of the high degree of

-2-

standardization, allow only a few words to be personalized, and have a relatively short term interest for the recipient.

The U.S. Patents Nos. 3,892,427 and 3,982,744 disclose a process for manufacturing the "ME" type books and illustrate clearly that the insertion of the personalized textual material must be accomplished in the book printing environment. Consequently, "ME" books are usually purchasable from the manufacturer or publisher by mail with a substantial time delay between ordering and receipt.

-3-

BRIEF STATEMENT OF THE INVENTION

Faced with this state of the art, we set out to produce documents which are personalized in both the pictorial and textual backgrounds. The apparatus includes means for converting personalized data such as height, build, sex, hair line and the like into control signals for producing a pictorial figure having physical characteristics similar to the personalized data introduced into the system. The apparatus also includes means for introducing personalized text into standard text and for combining this resulting personalized text with the appropriate pictorial background.

We devised a method employing a standard microprocessor which is programmed to provide the storage and combining functions after personalized data is introduced into the system by temporary storage by the purchaser or user on a storage medium such as a punched card.

-4-

BRIEF DESCRIPTION OF THE DRAWING

This invention may be more clearly understood from the following detailed description and by reference to the drawing in which:

Fig. 1 is a simplified physical layout of a system of this invention;

Fig. 2 is a block diagram of the system of Fig. 1;

Fig. 3 is a reproduction of one form of input device, namely a codable card for inputting personalized data;

Fig. 4 is an example of a sports favorite pictorial representation to be controllably inserted into the standardized background under the control of the computer of this invention;

Fig. 5 is an example of personalized text to be inserted into the standardized text of the control in the computer in accordance with this invention;

Fig. 5A is an example of standard text to be personalized;

Fig. 5B is an example of standardized background;

Fig. 6 is a flow diagram of the computer operation of this invention;

Fig. 6A is a flow diagram of the entire process of this invention;

Fig. 7 is an example of an overall.

-5-

DETAILED DESCRIPTION OF THE INVENTION

In contrast to prior systems for producing personalized books, we have determined that it is possible, employing a microprocessor based computer system, to develop a system capable of not only text personalization, but graphic personalization, as well in producing books, posters, greeting cards and the like. This is accomplished employing the microcomputer system shown in Fig. 1, comprised of basically the microprocessor based computer 10, having two inputs per example from card reader 11 and keyboard 12 of a respective cabling or other links 13 and 14. The computer 10, for example, may be Z80 CPU chip based, and communications may be by RS 232C ports. We have found that the S100 bus system, Model 2200 of California Computer Systems, Inc. of Sunneyvale, California is particularly suited for this use. It affords the flexibility to allow the same basic computer system, by the addition of operating cards, to provide a broad variety of signal processing. This makes it possible to combine personalized text and pictorial information with fixed backgrounds and text. The input device 11 may be a Micro Mark 1 card reader produced by the True Data Corporation of Irvine, California. The manual input device keyboard 12 may be any of a number of standard keyboards, but we have found that the Netronics keyboard produced by Netronics R&D, Ltd. is satisfactory for our purpose.

The output of computer 10 over cable 15 is reproduced on plotter 16 which may, for example, be a Bausch & Lomb, Huston Instruments Division, DMP 29 eight

-6-

pen plotter. The plotter 16 is designed to receive paper up to 11 by 17 inches in size, blank or preprinted, and to move any one of the series of eight pens of different colors from holders, unshown in the drawing, by carrier 21 to positions on the plotting surface 22, to imprint any of eight different colors in patterns as controlled by the computer 10. As here described, the computer system is made up of standard components and becomes specialized on the additional plug-in firmware represented on boards 23.

The system of this invention is interactive to guide the operator in the proper inputs to the computer and as such uses a monitor 24 which is viewed by the operator while sitting at the keyboard 12. Instructions such as "insert data card" appear on the screen at the beginning of the sequence, and if the data card is correctly read by the card reader 11, a message such as "card data entered" will appear on the screen.

Now referring to Figs. 2 and 3, the apparatus of this invention may be more clearly understood and illustrates that the input device, namely card reader 11, is furnished with coded card 30 of the type illustrated in Fig. 4. The user has blackened out appropriate squares as in the case of Fig. 3. He has punched out perforations, in the case of a punched card reader 11. In this case, the reader of the optical type is preferred and used. Data is likewise enterable on the keyboard 12 and therefore in Fig. 2 the normal direct data source is indicated by the solid arrow with the alternate data source indicated by the dashed arrow. Both the card reader 11 and the keyboard 12 provide personalized data

-7-

to the computer 10 into which the plurality of firmware cards may be inserted to vary the type of output product produced. The firmware cards are represented in Fig. 1 by the reference numeral 17 but actually are within the computer housing 10, and are associated with the particular preprinted background or backgrounds 31 as of the types shown in Fig. 7 which are inserted into the plotter 16 prior to plotting. Note that a buffer 32 is connected between the computer 10 and plotter 16. This buffer has, for example, 64 bytes of memory and is used because the computational speed of the computer 10 is greatly in excess of the speed of plotter 16. The computer 10 is capable of driving more than one plotter on a time share basis and for that reason a second buffer, 32A, indicated in dashed lines, and second or optional plotter, 16A, may be used with the system. The computer 10 may easily drive three plotters. During data input computation and throughout the entire process, the monitor 24 provides information to the operator.

When the plotting is finished, the final product 34 is a standard pictorial background interspersed with standard text which is modified by the presence of personalized text and personalized foreground pictorial information. The interrelationship of the standard and personalized information is best illustrated by reference to Fig. 5B. In this figure, a small portion of the preprinted pictorial background of Fig. 7 is shown. The entire document as illustrated in Fig. 7 includes a number of sections, one of which relates to sports and hobbies.

-8-

Now referring specifically to Fig. 3, a card 30 is shown in a form which is in part readable by eye and in part optically read by card reader 11 of Figs. 1 and 2. The card 30 includes lines for introducing the name of the subject of the card as has been done, in this case, SEAN, and other personalized data such as his birthdate are shown entered manually by pen or pencil.

A number of personalized data are entered in the card by blacking out the appropriate choice, the first choice being three age categories; the second category for gender allows, of course, two selections. In this manner, the caricature, which will be printed, bears a certain relationship to the subject, specific enough that the person may be recognizable or at least recognized as represented in caricature. Also, it should be noted that a number of the selections and the general tone of the examples are humorous since this system is most frequently desired to produce a humorous type of poster, card or other form of presentable material but is not so limited.

In addition to the data related to the physical characteristics of the subject, in this particular example, a sport or hobby is selectable. The demonstration and explanation of the operation of the invention is given where the subject or the giver of the presentation has selected each of the characteristics noted by the blackened in boxes on the card 30, and also has selected racquet sports as the sport or hobby of the subject. The optical reader 11 of Figs. 1 and 2 is designed to scan a card which is inserted in its appropriate opening and register the data positioned

-9-

aligned with any one of the optical index marks 30A appearing on the left hand margin of card 30. The card reader 11 therefore makes no attempt to read the handwritten name or birthdate or the demonstration block appearing toward the top of the card. The handwritten data is introduced into the computer 10 of Figs. 1 and 2 via keyboard 12.

Stored in the memory of the computer 10, particularly in the firmware 17, are directions to the plotter to plot a large number of physical characteristic shapes which are associated with the selections made on card 30. As an example, in the case of noses, twelve different noses of various sizes and shapes, have been stored including directions for their location in the pictorial printout. These noses appear as a part of Fig. 4 below the card 30. In this case, card 30 has been marked with a small nose of a male under 18 and the equivalent of Caucasian. Those criteria along with the particular sport selected, in this case racquet sport, denote that the encircled nose is appropriate. Similar selections are made for eye, mouth, chin and ear from stored pictorial data. The hair, denoted by the reference 76, has been selected on the basis of the sex, age, type, length and color of hair as well as the sport.

As is apparent in Fig. 4, as partial figure holding a racquet, wearing a visor, in appropriate attire and about to be struck by a ball, has likewise been stored. The stored partial figure is selected on the basis of the sport selected as well as sex and in certain cases, age.

-10-

The size and shape of the partial figure and the blank areas left are selected and determined in order that each of the components making up a caricature, in this case the hair, eye, nose, mouth, chin and ear, all fit within the appropriate open space to complete the partial figure of a racquetball player. Likewise, the outline shape of the racquet player, when completed, is of appropriate size and shape to fill a blank area in a part of the background graphics of the final document to be delivered. In this case, a stylized hand is shown in Fig. 5A holding some playing cards with the nearest playing card having a space. Below the space for the caricature are other spaces available to take the subject's name and a personalized statement, related in this case, to the sport selected. In the example given, the subject's name, SEAN, along with the expression, "THE WILD RACQUETEER", are inserted below his caricature.

Fig. 5 in combination with Fig. 5A show the integration of personalized text into standardized text. In this case, the personalized text is the subject's name, SEAN, and the statement, "AT PLAY". Also appropriate but not required in this particular text is the substitution of gender terms such as "his" or "hers" based upon the selection of gender made on card 30. When completed, the document, which may be a poster, card, booklet or the like, includes the standardized text shown in Fig. 5A, the personalized text illustrated in Fig. 5, the background graphics shown in Fig. 5A, and the foreground, personalized graphics or pictorial display of Fig. 4. The source of the personalized information is the card 30 with most of the information introduced into

-11-

the computer by the card reader 11, but the actual spelling of the name and birthdate are introduced by the keyboard 12.

The complete process from beginning to end is illustrated in Fig. 6 including the preparation of the background material, which is actually printed in a conventional printing manner in multiple color presses. An inventory of the backgrounds is maintained by the operator of the system and the appropriate background is inserted into the plotter on its surface 22 where a personalized poster can be made.

All of the various foreground personalized variables are drawn and furnished to a programmer to develop the program to control the selection and direction of the plotter to produce the selected personalized pictorial material at the appropriate place on the background. This is done by developing the program and introducing it into firmware for the computer 10.

At the point of manufacture of the end product, which usually corresponds to the point of sale, the personalized data is introduced onto the card 30 and certain personalized data introduced by the keyboard operator at the time the personalized data is read from the card 30.

The computer 10 stores the personalized data and personalized pictorial information as well as the standard text which is printed in addition to that text which may be on the preprinted background. The computer 10 combines each of these inputs to develop control signals to the plotter 16 as to position, color, graphics

-12-

to be plotted, order of operations and conveys its commands to the plotter 16, which then proceeds to make the completed plot.

In the example given in Figs. 4, 5 and 5A, a portion of a larger poster as illustrated in Fig. 7 will be plotted with the name, SEAN, appropriately inserted into the text. The sport quotation, "AT PLAY" is inserted into the text and the selection of variable facial characteristics, hair style and sport will be combined and printed in the background space of Fig. 5A. The titling of the caricature is accomplished under the control of the computer by insertion in the title line of Fig. 5A the subject's name and a characterization of the sport, in this case, "WILD RACQUETEER".

As final steps in the manufacture, the operator inspects the final product to make certain that proper registration has occurred between the pre-printed material and the newly added graphics and text, and that the caricature and comments are reasonable. Thereafter, the computer 10 and plotter 16 are free to proceed with the next plot. The cards 30, already made, may be retained to make duplicates or returned to the customer.

The computational steps as well as the control and storage steps in the computer 10 are accomplished under the control of a program written, in this case, in Microsoft basic 80 language available from the Microsoft Corp. of Bellevue, Washington and represented by the listing accompanying this application. The listing covers the steps for producing the sports caricature as described above and of course the full program for making multiple caricatures will be longer but constitute

-13-

basically redundant operations to those illustrated herein.

The program which accompanies this disclosure includes statements 10 through 15420 in Microsoft Basic 80 language. The steps carried out by the computer 10 under the control of the program, reads the data card, stores the data, makes the required selections, correlates the data to select appropriate images and causes the plotter to print the personalized text and to draw the personalized pictorial images. The subject's name is printed on a banner along with his birth date. In the example given, the background is selected on the bases of the subject's astrological sign for the particular humorous example here disclosed. Other formats may be used.

The steps in the program are basically as follows:

STEPS	FUNCTION
10-430	TITLE BLOCK
440	ALLOCATING MEM

15420	RETURN

The operation of the computer 10 under the control of the program as listed and accompanying this application is illustrated in the flow chart of Fig. 7. The listing includes the initial steps of selecting the background based upon the subject's birthdate and the length of the subject's name for purposes of spacing the name on the final product. The steps thereafter relate to the processing to select appropriate facial characteristics, and sport or hobby for the personalized pictorial portions of the end product.

The steps of the process include the reading of the data card and storing the data read in the various files as strings. Next the series of select functions from the stored permanent features occurs. The select functions depend upon the data of the particular subject, e. g. male vs female, under 18 vs older subjects, race or ethnic group and hair quantity and style as well as sex. Whether the subject wears glasses or not is selected as is his bearded or non bearded status. The sport or hobby selected on the card 30 is selected and the presence or absence of goggles is determined for that sport. If the subject wears goggles according to the sport selected, the presence of glasses is ignored.

In performing the select functions from the stored pictorial data, the following data inputs are used

-16-

in each respective selection.

SELECT STEP	DATA			
Select sport		sex		sport
Select nose	age	sex	race	size
Select eyes	age	sex	race	color
Select face	age	sex	race	build
Select glasses	age	sex	race	sport
Select beard	age	sex	race	hair color
				style
Select mouth	age	sex	race	sport
Select hair	age	sex	race	hair color
				amount
				type
				sport

After the selection steps are completed, with less than 9 selections, the sequential files are opened and thereafter the data in the files is read in sequence and plotted. After each file is incrementally read and plotted the files are closed and the sequence stops. The document is completed.

Characteristic of this invention is the fact that a variety of physical characteristics of the subject are stored along with personal data such as their favorite sport and their name and birthdate. The various inputs are combined to produce a caricature and combine information as appropriate into the text whereby the end product in both words and picture assume a personalized nature for the recipient. The detailed nature of the

-17-

caricature is such it can allow the recipient continuing interest and amusement, much more than merely the presence of his name in text, which is also achieved by this invention.

The foregoing embodiments are merely illustrative of this invention and are not to be considered as restrictive. It is recognized that one skilled in the art may make modifications of an invention without departing from the spirit and concept of the invention. Therefore my invention is instead defined by the following claims and their equivalents.

WHAT IS CLAIMED IS:

1. The method for producing a personalized pictorial and text presentation comprising the steps of;
storing selected personal information and physical data of a person;
storing pictorial background information to be used in the preparation of the presentation;
storing standardized textual information compatible with the pictorial background information;
converting the stored personal and physical data to a pictorial representation of a person;
combining the standardized textual information with the personal information to provide personalized text information; and
reproducing a personalized pictorial rendition against the stored pictorial background accompanied by personalized text.
2. The method in accordance with Claim 1 in which the storing of personal information and physical data is done by physically entering the data on a common media.
3. The method in accordance with Claim 2 whereby the storing of personal information and physical data is accomplished by making machine readable marks on and by machine reading a card.
4. The method in accordance with Claim 1 wherein

-47-

the step of converting the physical data is accomplished by storing a plurality of pictorial representations of different physical characteristics;

comparing the physical data inputted with the stored pictorial representations; and

selecting the matching pictorial representations for reproduction.

5. The method in accordance with Claim 1 in which the step of combining personal data and standardized text information comprises the step of inputting the personal data into a computer which stores the standardized text information in the appropriate position in the text; and

selecting appropriate gender for the standardized text.

6. The method in accordance with Claim 1 in which the step of reproducing the combined pictorial and textual greeting card or poster comprises the step of printing the personalized textual and pictorial information on a standardized background including standardized text and background with the personalized textual information inserted in the blanks in the standardized text and personal pictorial rendition inserted in the blanks in the stored pictorial background.

-48-

7. Apparatus in accordance with claim 6 including means for selecting appropriate language based upon at least one of the following factors: age, sex, and pastime.

8. A method of producing a personalized drawing of a user within preprinted background material comprising the steps of:

recording a plurality of factors affecting the user's appearance;

selecting at least two predesigned visual features most fitting to the user from a plurality of predesigned visual features in accordance with the plurality factors affecting the user's appearance;

automatically controlling a plotter to draw the at least two predesigned visual features most fitting to the user within the preprinted background material to produce a continuous and personalized drawing of the user.

9. The method in accordance with claim 8 in which the at least two visual features most fitting to the user comprise the user's nose, hair style, eye, chin and ear.

10. The method in accordance with claim 9 in which the plurality of factors affecting the user's appearance comprise the following factors:

the user's age;

-49-

the user's sex;
the user's race;
the length of the user's hair;
the color of the user's hair;
the user's hair type;
whether the user has facial hair;
the size of the user's nose;
whether the user wears glasses; and,
the user's build.

11. The method in accordance with claim 10 in which the personalized drawing of the user comprises a profile.

12. The method in accordance with claim 8 further including the steps of:

recording a favorite pastime of the user;
selecting a predesigned action background material in accordance with the recorded favorite pastime of the user; and,

automatically controlling the plotter to draw the selected predesigned action background material and incorporating the at least two visual features most fitting to the user within the selected predesigned action background material to produce a continuous and personalized drawing of the user acting out his/her favorite pastime.

13. Apparatus for producing a personalized pictorial and text document from standardized text

-50-

material and pictorial background and personal data comprising:

a standardized document including text and pictorial background, each of which include blank portions therein;

computer means for:

a) storing the locations of the blank positions in said standardized document;

b) storing selected personalized data introduced into to the computer;

c) converting the stored selected personalized data into the personalized text and pictorial representations and the intended location thereof;

d) controlling the movement of an impression producing device for producing the personalized text and pictorial representations on the standardized document in the appropriate locations on the standardized document; and

an impression producing device for reproducing on said standardized document, the personalized text and pictorial representations.

14. The combination in accordance with Claim 12 including input means for said computer for introducing physical information with respect to the subject of the personalization and wherein said computer includes means for converting said personalized data into control signals for said impression producing device to produce a

-51-

pictorial representation bearing a correspondence to the physical data inputted.

15. The combination in accordance with Claim 14 where said computer stores a plurality of control signals for producing a variety of different pictorial representations and including means for selecting the control signal corresponding to the physical information introduced into the input means.

16. The combination in accordance with Claim 12 wherein said input means includes a card reader for introducing physical information and a keyboard for introducing personalized text material.

17. The combination in accordance with Claim 12 wherein said impression producing device comprises a plotter adapted to receive said standardized document for plotting thereon and control signals from said computer for producing the personalized text and pictorial information.

18. The combination in accordance with Claim 13 wherein said computer means includes means for storing a plurality of control signals for said impression producing device, one control signal for each of a number of stored components of a pictorial representation and one control signal for each variation of each of said stored components depending upon the personalized data introduced into the computer means.

-52-

19. The method for producing a personalized pictorial and text presentation comprising the steps of;

- storing selected personal information and physical data of a person;
- storing pictorial background information to be used in the preparation of the presentation;
- storing standardized textual information compatible with the pictorial background information;
- converting the stored personal and physical data to a pictorial representation of a person;
- combining the standardized textual information with the personal information to provide personalized text information; and
- reproducing a personalized pictorial rendition against the stored pictorial background accompanied by personalized text.

20. The method in accordance with Claim 1 in which the storing of personal information and physical data is done by physically entering the data on a common media.

21. The method in accordance with Claim 2 whereby the storing of personal information and physical data is accomplished by making machine readable marks on and by machine reading a card.

22. The method in accordance with Claim 1 wherein the step of converting the physical data is accomplished by storing a plurality of pictorial representations of different physical characteristics;

-53-

comparing the physical data inputted with the stored pictorial representations; and

selecting the matching pictorial representations for reproduction.

23. The method in accordance with Claim 1 in which the step of combining personal data and standardized text information comprises the step of inputting the personal data into a computer which stores the standardized text information in the appropriate position in the text; and

selecting appropriate gender for the standardized text.

24. The method in accordance with Claim 1 in which the step of reproducing the combined pictorial and textual greeting card or poster comprises the step of printing the personalized textual and pictorial information on a standardized background including standardized text and background with the personalized textual information inserted in the blanks in the standardized text and personal pictorial rendition inserted in the blanks in the stored pictorial background.

-54-

25. A personalized text and pictorial printed presentation produced by the process of:

storing a plurality of segments of the facial features of various types;

storing a plurality of hair styles;

storing a plurality of clothing styles;

introducing personal data of a person to be characterized into a storage means, said personal data including age category, sex and race;

introducing personal data of a person including name into a storage means;

selecting facial features, hair style and clothing as a function of the personal data introduced into said storage means;

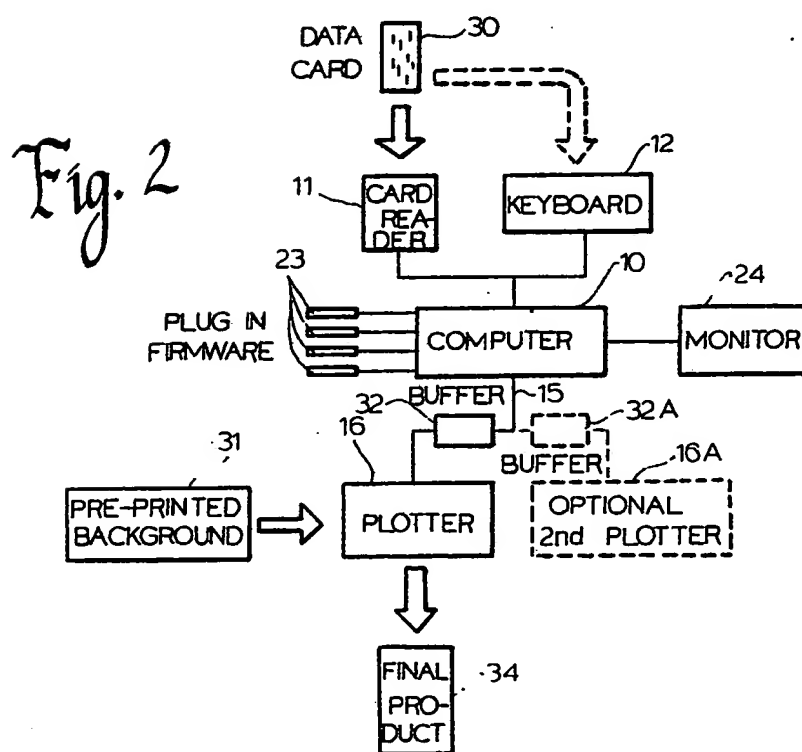

plotting a combination of facial features, hair style and clothing as selected to produce a pictorial characterization of the person; and

printing personal data such as the person's name along with the pictorial characterization.

26. The combination in accordance with Claim 25 wherein said presentation is printed on a preprinted background including standardized text whereby said standardized text and personal data such as the person's name constitute meaningful personalized text.

27. The combination in accordance with Claim 25 wherein the facial features stored include both front face and profile whereby both a front face and a profile of the person may be presented.

28. The combination in accordance with Claim 25 in which the storage means and selecting means comprises computer means.
